| <b>Date</b>          | 11 September 2026                                    |
| <b>Project Type</b>  | Individual Project                                   |
| <b>Project Name</b>  | ServiceNow Based Employee Laptop Request Application |
| <b>Maximum Marks</b> | 4 Marks                                              |

### 1. Ideation Phase Overview

The ideation phase identifies, organizes and prioritizes solutions for an individual ServiceNow project. The selected project is an Employee Laptop Request Application designed to digitize the request, approval, notification and IT fulfilment process.

Project objective: Build a centralized ServiceNow application where employees can submit laptop requests, managers can approve or reject them, and the IT team can process approved requests with controlled access and automated communication.

### Step 1 – Problem Identification & Problem Statement

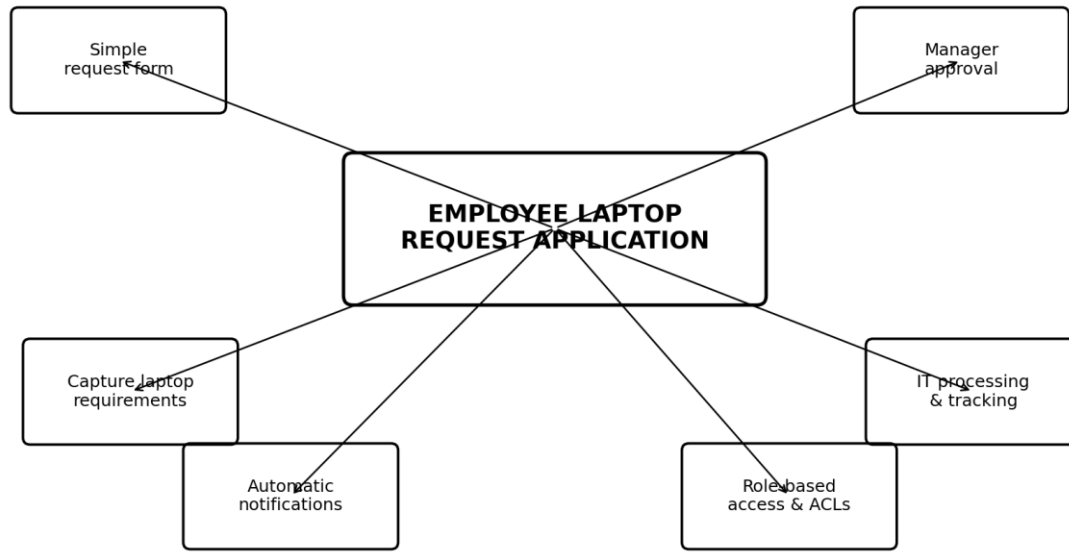

Problem: Employee laptop requests can become difficult to manage when information, approvals and status updates are handled manually or through disconnected communication.

How Might We Statement: How might we create a simple, secure and automated ServiceNow application that lets an employee request a laptop, routes the request to the appropriate manager for approval, notifies the relevant users, and enables IT to track and fulfil the request?

Key requirements identified:

- Easy employee laptop request form.
- Capture required employee and laptop details.
- Manager approval and rejection process.
- Automated email/status notifications.
- Request status tracking.
- Role-based access for Employee, Manager and IT users.
- ACLs to restrict unauthorized access.
- IT processing and fulfilment of approved requests.

## Ideation - Employee Laptop Request Application

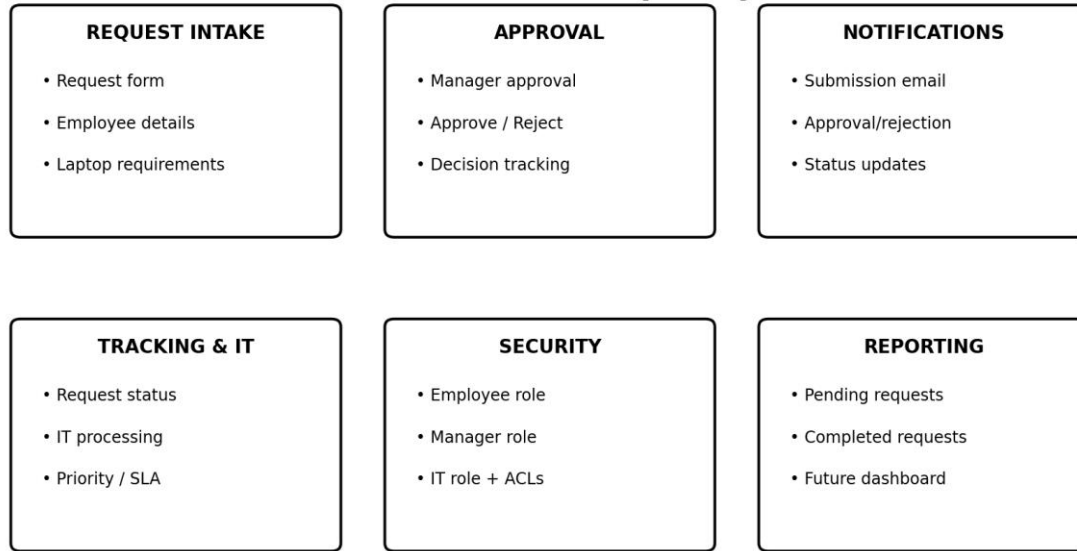

## Step 2 - Brainstorm, Idea Listing & Grouping

The ideas below were generated specifically for the Employee Laptop Request Application and grouped according to their role in the solution.

| #  | Idea                            | Group              |
|----|---------------------------------|--------------------|
| 1  | Employee laptop request form    | Request Intake     |
| 2  | Capture laptop requirements     | Request Intake     |
| 3  | Manager approval / rejection    | Approval           |
| 4  | Automatic request notifications | Notifications      |
| 5  | Request status tracking         | Tracking           |
| 6  | IT processing and fulfilment    | IT Processing      |
| 7  | Employee / Manager / IT roles   | Security           |
| 8  | ACLs for controlled access      | Security           |
| 9  | IT request monitoring           | Reporting          |
| 10 | Future inventory integration    | Future Enhancement |

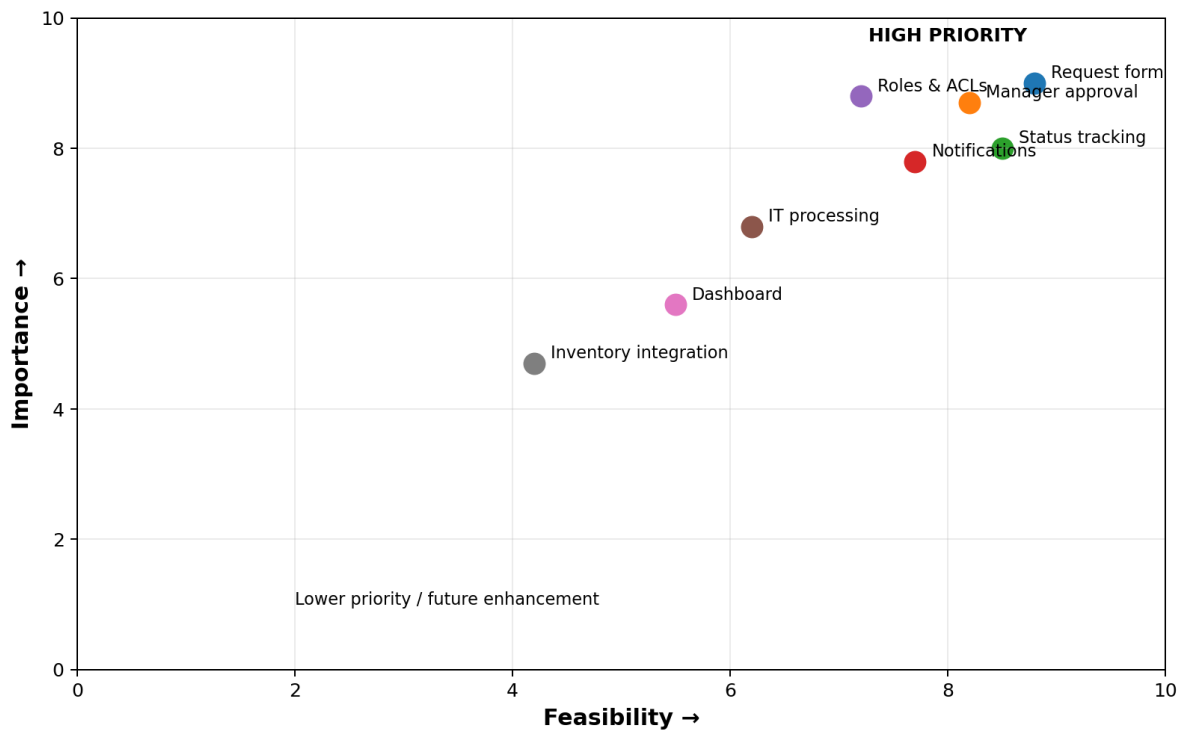

## Brainstormed Ideas - Grouped by Function

## Step 3 – Idea Prioritization

Ideas were prioritized using Importance versus Feasibility. High-value and practical features were selected as the core project scope.

### Idea Prioritization - Employee Laptop Request

| Priority | Selected Idea                | Importance | Feasibility |
|----------|------------------------------|------------|-------------|
| 1        | Employee laptop request form | High       | High        |
| 2        | Manager approval /           | High       | High        |

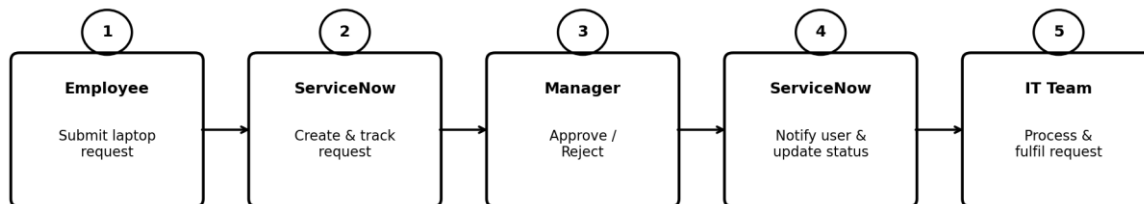

|   |                            |        |        |
|---|----------------------------|--------|--------|
|   | rejection                  |        |        |
| 3 | Request status tracking    | High   | High   |
| 4 | Automated notifications    | High   | High   |
| 5 | Roles and ACLs             | High   | High   |
| 6 | IT processing / fulfilment | High   | Medium |
| 7 | Monitoring / dashboard     | Medium | Medium |
| 8 | Inventory integration      | Medium | Low    |

## Step 4 – Final Selected Idea

Selected Idea: ServiceNow Based Employee Laptop Request Application.

This solution is selected because it directly addresses the problem while using standard ServiceNow capabilities such as custom tables/forms, Flow Designer, notifications, roles and ACLs.

### Selected Solution - End-to-End ServiceNow Flow

## Functional Components

| Component             | Purpose                                                    |
|-----------------------|------------------------------------------------------------|
| Employee Request Form | Collect laptop request and requirement details.            |
| Laptop Request Table  | Store and track each request.                              |
| Flow Designer         | Automate approval, status updates and notifications.       |
| Manager Approval      | Approve or reject submitted requests.                      |
| Notifications         | Inform users about submission and decision/status changes. |
| Roles & ACLs          | Control who can read, create or modify request records.    |
| IT Processing         | Process and fulfil approved requests.                      |

## Expected Benefits

- Standardized and faster laptop request submission.
- Reduced manual approval follow-up.
- Better visibility of request status.
- Automatic notifications through workflow.
- Improved security through roles and ACLs.
- Centralized tracking for IT processing.
- Expandable design for future reporting and inventory integration.

## **Conclusion**

The ideation process resulted in a practical, high-value ServiceNow solution for managing employee laptop requests. The individual project focuses on automating the complete request lifecycle from employee submission through manager decision and IT fulfilment.
