

Project Design Phase
Proposed Solution Template

Date	13-09-2026
Project Name	Service now based employee laptop Request Application
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Employees often face difficulties in requesting laptops through manual or unorganized processes. Requests may be delayed, difficult to track, or lack proper approval and status visibility. The proposed application solves this problem by providing a centralized and automated system for submitting, approving, rejecting, and tracking employee laptop requests.
2.	Idea / Solution description	The solution is a ServiceNow-based Employee Laptop Request Application. Employees can submit laptop requests through a request form by providing the required details. The request is automatically processed through a workflow where the responsible manager can approve or reject it. Notifications are sent to the concerned users, and the request status can be tracked throughout the process.
3.	Novelty / Uniqueness	The application provides an automated and centralized laptop request process instead of relying on manual communication. It combines request submission, role-based access, approval or rejection, workflow automation, business rules, and notifications in one ServiceNow application. This improves transparency, reduces manual effort, and provides better control over employee laptop requests.
4.	Social Impact / Customer Satisfaction	The application improves the employee experience by making laptop requests simple, transparent, and easy to track. Employees receive timely updates about their requests, while managers can review and process requests efficiently. The reduction of manual work and delays can improve productivity, communication, and overall user satisfaction.
5.	Business Model (Revenue Model)	The application is primarily an internal enterprise solution and does not directly generate revenue. Its business value comes

		from reducing administrative effort, minimizing manual processing, improving resource management, and saving time for employees and managers. The solution can also support organizations in reducing operational costs associated with manual request handling.
6.	Scalability of the Solution	The application can be easily extended to support a larger number of employees and additional IT asset requests such as desktops, monitors, keyboards, mobile devices, and other equipment. Additional approval levels, departments, notifications, reports, and automated workflows can also be added as organizational requirements grow.
